

Project

The development of an online intervention to reduce HIV/STI risk and drug use-related harms among stimulant-using MSM in Malaysia

Objective

This study aimed to develop a community-based, online intervention to cater the mental health and sexual health needs for stimulant-using MSM in Malaysia. Participants will be able to access harm-reduction information, support for drug use recovery, as well as peer counseling on sexual risk reduction at their own privacy and convenient time. The study will build the capacity of community-based organization in reaching stimulant-using MSM and provide evidence-based, psychosocial support to these men who are vulnerable to a range of adverse health outcomes, including depression, suicidality, HIV/STI/Hepatitis C & B Infection.
